

VAM Load Pose presets

If you already have imported scenes to vam, with high probability they will also be already poses available in vam
But you can also download Pose presets and add them to vam
For that select Resources on the VAM Website, go to Free and select Poses
You will then find a lot of Pose Packs, you can download

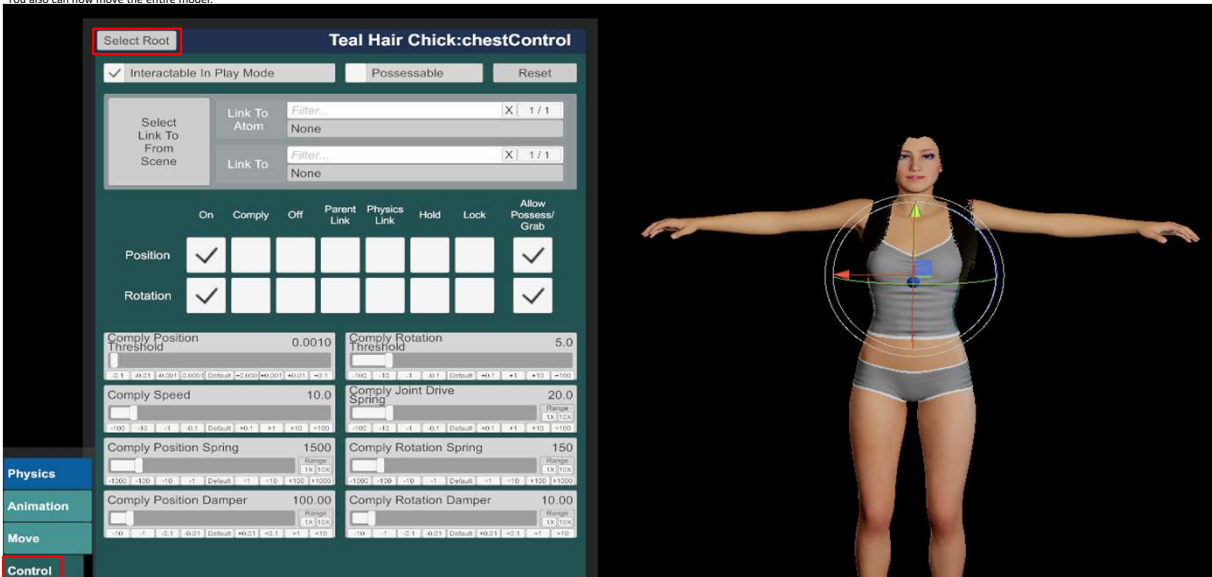

For this example, i choose Standing Pose(001-256) from kphg2
Just Download the Var File and put it in your AddonPackages Folder in your Virt-a-Mate\Prog Folder

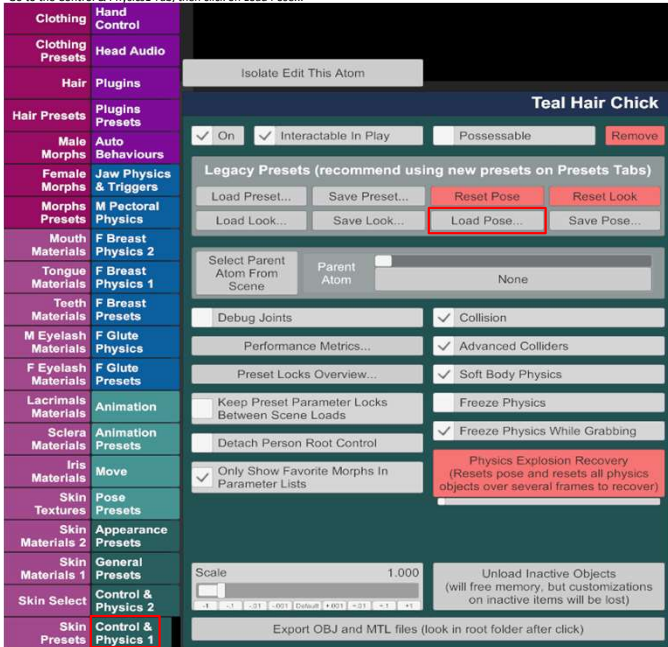

If you are already in vam, new added resources will not automatically be loaded.
You have to either restart the program or reload packages
For reload packages, click on Open Package Manager

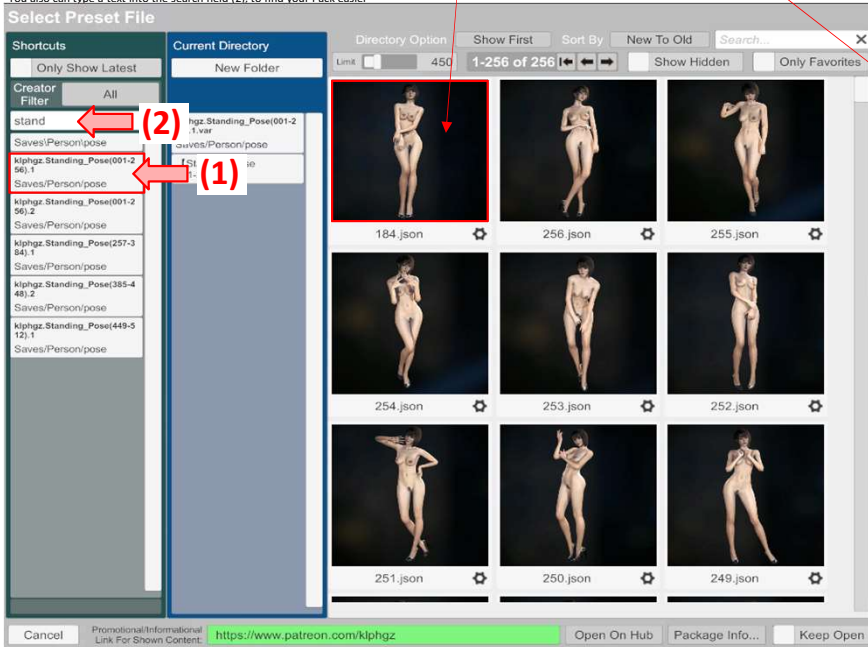

Now select your character, make sure you are on the control tab, then click on Select Root
By the way, if you click on your model to select it, you will automatically select the part of the model you click on
In other words, there is only a part of the model selected, not the whole model, you can also not move the entire model, if just a part is selected
This is why you have to Select Root, now the entire Model is selected and you can modify stuff and do things you cant if only a part is selected.
You also can now move the entire model

Go to the Control & Physics1 Tab, then click on Load Pose...

Select your Pose Pack (1), then select the Pose you want to load, in this Case Pose 184, by clicking on it, the pose will automatically load
You also can type a text into the search field (2), to find your Pack easier

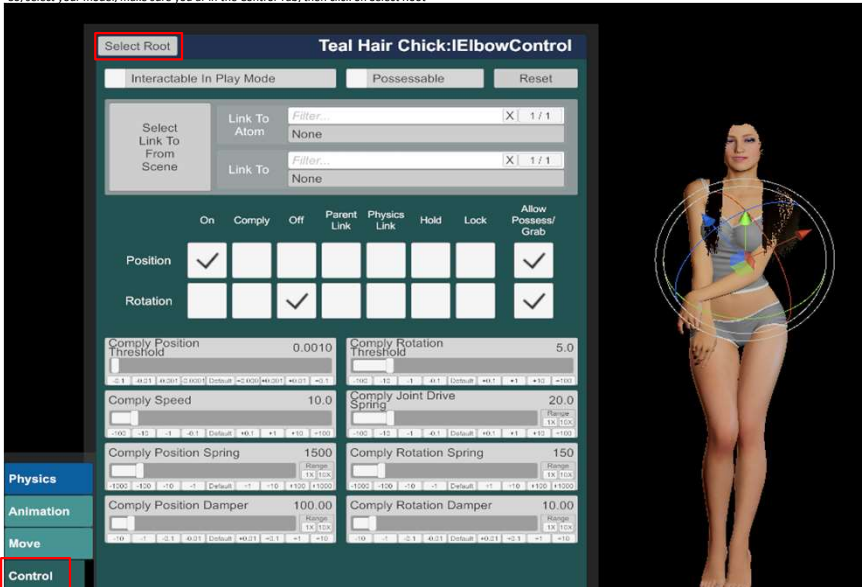

It may be, that you have added a pose pack and it will not show up here.
Some Pose Packs dont show up here and have to be loaded in another way.
But first make sure, that the search field ist empty, to rule out that this is where the problem comes from
If it still doesnt show up, we go now to the second option on how to load pose presets

For the second example i downloaded the Ass Ready Pose 0.1 Pack from guru33
Download the Var File and again put it in your AddonPackages folder in your Virt-a-Mate\Prog Folder
Restart the Program or reload Packages as described above

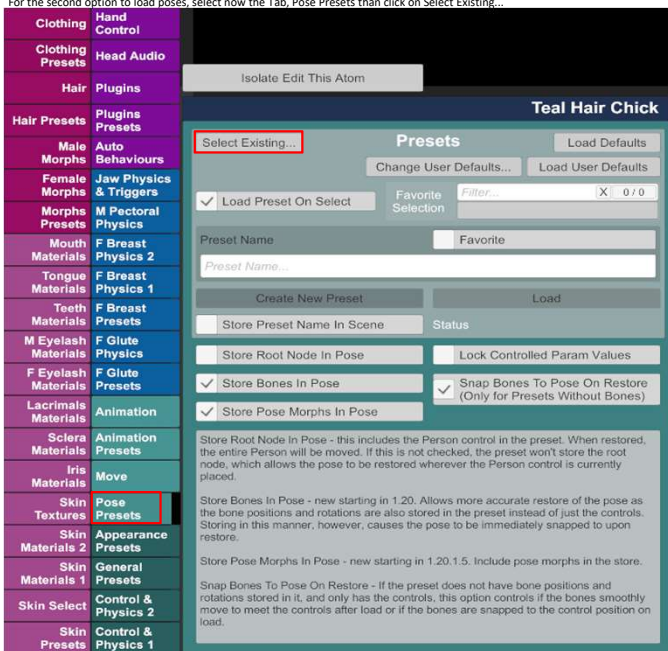

Now in this case, this package doesnt show up in the Select Preset File window from above.
That's definitely the case for me, maybe it's different in your case, therefore check out first, if the Package shows up.
If yes, you dont need the second way to load a pose, if it doesnt show up, we now use another way to load it.

So, select your model, make sure you are in the Control Tab, then click on Select Root

For the second option to load poses, select now the Tab, Pose Presets than click on Select Existing...

In this Window, the Package now shows up and you can select it, so the poses appear on the right side. By now clicking on a pose, the model will automatically get in that position
